The Email Laundry Solution

Email Archiving and Continuity solved for ADM Londis by The Email Laundry ADM Londis were trying to solve the problem of archiving all historical email and making them easily accessible to all end users and for central company searches. This need was compounded by the need to have an email continuity plan in case of server downtime or other disaster scenario. ADM Londis also wanted to reduce the load on their current email server.

"We are delighted with the results" said Emma from ADM Londis, "as the solution is Cloud based we didn't have to deploy appliances on site. All updates and additional features that come on stream are free. We are secure in the knowledge that if our email server goes down we can send and receive email from the archive."

They were recommended the perfect solution for this set of needs. The Email Laundry archiving and continuity service was set up for a trial within a day. The service is a software as a service model so it was very simple to deploy. All ADM Londis email traffic was copied in real time to The Email Laundry's hosted archiving service where it was indexed and safely stored in a SAS 70 type II data centre and encrypted to disk. The archive was made available to the end users through a secure folder in their desktop email client, or a web portal or OWA. The search facility on the archived email is quick and responsive with filters in place to further refine searches.
