

# Email Is Your Company's Biggest Vulnerability

- 91% of successful attacks begin with a phishing email
- Losses from targeted CEO fraud attacks are growing over 300% year on year
- 46% of all ransomware attacks originated from email
- Every year 75% of companies suffer from loss of access to email

In the vast majority of cases, the activation of digital attacks is completely accidental and simply caused by someone opening the wrong email. An email that would have never landed in their inbox with the right security system...

## The Email Laundry Is the Leading Cloud-Based Email Security Service

No Hardware, No Software, No Maintenance, No Hassle

Here are some of the features we employ to keep your emails – and your company – safe from attack:

- Stop all known viruses
- Capture over 99.99% of spam with zero false positives
- Provide phishing protection against emails with malicious web links
- Includes URL scanning to identify threats
- CEO fraud and ransomware protection

# PROTECTION FROM

*Keeping Email Safe*

# Full Stack Email Security

How our service works to protect you:

## Level 1: Threat Intelligence

The Email Laundry security analysts mine the entire DNS system for indicators of cyber-criminal behavior. We analyze the data, apply our knowledge and use this intelligence to protect our customers from threats they didn't know existed.

## Level 2: Reputation-Based Algorithms

Developed in-house, our industry-leading algorithms can identify whether an email is coming from a genuine email server or is just internet 'noise'. If the email is recognized as spam, the customer doesn't need to see it, so the connection is dropped. Logs are retained on the service for reference if needed in the future.

## Level 3: Anti-Virus Protocols

Each email that passes through The Email Laundry's protection system is scanned by five separate anti-virus engines. Three of these are signature-based, while the other two are behavioral-based engines to ensure the system captures new viruses and malware, these are also continuously changing to take advantage of the best performing engine.

## Level 4: Content Assessment

Every email is put through a range of filters to examine different aspects of its content. This includes assessing embedded URLs for malicious links and investigating header and body content for 'spammer' indicators.

## Level 5: User Specifications

Customers also have a number of options when it comes to what is presented in their inbox. Through the customer web interface, they can block macros, zip files, executable files, and more as well as implement white and black lists.

## Level 6: Encryption Options

We provide customers with many options for utilizing our encryption features. We believe in letting the customer choose the type of encryption that suits their business.
